"Crystal structure of a complement factor D mutant expressing
T "Crystal structure of a complement factor D mutant expressing
T enhanced catalytic activity.";
J. Biol. Chem. 270:24399-24405(1995).

J. Biol. Chem. 270:24399-24405 (1995).

-!- FUNCTION: Factor D cleaves factor B when the latter is complexed
with factor C3b, activating the C3bbb complex, which then becomes
the C3 convertase of the alternate pathway. Its function is
homologous to that of C1s in the classical pathway.

-!- CATALYITC ACTIVITY: Cleaves component factor B (Arg-|-Lys) when in
complex with C3b or with cobra venom factor (CVF).

-!- SIMILARITY: Belongs to peptidase family S1.

-!- CAUTION: In addition to the conflicts shown in the feature table,
Ref.3 sequence had a peptide in the wrong order and another one
missing.

CATALYTIC ACTIVITY: Specific cleavage of Arg- -Val bond plasminogen to form plasmin.

SUBUNIT: Monomer.

SIMILARITY: Belongs to peptidase family S1.

SIMILARITY: Contains 1 EGF-like domain.

SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. -I- FUNCTION: Probably essential to support the feeding habits of
exclusively haematophagous animal. Potent thrombolytic agent.
-I- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.

EMBL
                                 o rg
ENZYME REGULATION: Activity toward plasminogen is stimul the presence of fibrin I.
SUBUNIT: Monomer.
DOMAIN: The fibronectin type-I domain mediates binding tand the kringle domain apparently mediates fibrin-induce stimulation of activity.
SIMILARITY: Belongs to peptidase family S1.
SIMILARITY: Contains 1 EGF-like domain.
SIMILARITY: Contains 1 fibronectin type I domain.
SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SALIVARY PLASMINOGEN ACTIVATOR FIBRONECTIN TYPE-I. EGF-LIKE.

CATALYTIC ACTIVITY: Specific cleavage of Arg- -Val bond in plasminogen to form plasmin.

ENZYME REGULATION: Activity toward plasminogen is stimulate the presence of fibrin I.

SUBUNIT: Monomer.
                                                                                                                                              uu

"Isolation, characterization, and cDNA cloning of a vampire salivary plasminogen activator.";

J. Biol. Chem. 264:17947-17952(1989).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DOMAIN: The fibronectin type-I domain mediates binding and the kringle domain apparently mediates fibrin-inducstimulation of activity.

SIMILARITY: Belongs to peptidase family S1.

SIMILARITY: Contains 1 EGF-like domain.

SIMILARITY: Contains 1 fibronectin type I domain.

SIMILARITY: Contains 1 kringle domain.
                                                                                                                                              Bringma
                                                                                                                                                                                  salivary gland
expression.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodeling and degradation, in cell migration and many other physiopathological events.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-{-Val bond in plasminogen to form plasmin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ength human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SUBCELLULAR LOCATION: Secreted; extracellular.

PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURT PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFT ARG-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEOUS: Binds to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.

"The structure of the TATA-less rat tissue-type plasminogen activator gene. Species-specific sequence divergences in the promoter predict differences in regulation of gene expression.";

J. Biol. Chem. 265:2022-2027(1990).

-!- FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodeling and degradation, in cell migration and many other physiopathological events.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-!- SUBUNIT: Heterodimer of chain A and chain B held by a disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CAN BE FURTHER

a collaboration
            generation of bradykinin and angiotensin.

-!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-ile bonds in factor VII to form factor XI to form factor XI a.

-!- PTM: O- AND N-GLYCOSYLATED (BY SIMILARITY).
-!- MISCELLANBOUS: Factor XII, prekallikrein, and HMW kininogen form a complex bound to an anionic surface. Prekallikrein is cleaved by factor XII to form kallikrein, which then cleaves factor XII first to alpha-factor XIIa and then to beta-factor XIIa. Alpha-factor XIIa activates factor XII to factor XIIa as it lacks the trypsin/kallikrein cleavage site.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 fibronectin type II domain.
-!- SIMILARITY: Contains 1 fibronectin type II domain.
-!- SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. L. FUNCTION: Factor XII is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the generation of bradykinin and angiotensin.

C.-!- FUNCTION: Factor XII is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the generation of bradykinin and angiotensin.

C.-!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-Ile bonds in factor VII to form factor XII, prekallikrein, and HWW kininogen form a complex bound to an anionic surface! Prekallikrein is cleaved by factor XII to form kallikrein, which then cleaves factor XII first to alpha-factor XII and then to beta-factor XIIa. Alpha-factor XII activates factor XI to factor XIa.

C.-!- SIMILARITY: Belongs to peptidase family SI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

the initiation of blood coagulation, fibrinolysis, and the the initiation of blood coagulation, fibrinolysis, and the the initiation of blood coagulation, fibrinolysis, and the generation of bradykinin and angiotensin.

-!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-11e bonds in factor VII to form factor VIIa and factor XI to form factor XIa.

-!- PTM: O- AND N-GLYCOSYLATED.
-!- DISEASE: Defects in F12 do not cause any clinical symptoms. The sole effect is that whole-blood clotting time is prolonged.
-!- MISCELLANEOUS: Factor XII, prekallikrein, and HMW kininogen form a complex bound to an anionic surface. Prekallikrein is cleaved by factor XII to form kallikrein, which then cleaves factor XII first to alpha-factor XII and then to beta-factor XIIa. Alpha-factor XII activates factor XI to factor XIa.

-!- SIMILARITY: Contains 2 EGF-like domains.
-!- SIMILARITY: Contains 1 fibronectin type I domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WARIANT TENRI CYS-53.

pir 78:* 1: pir1:* 2: pir2:* 3: pir3:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polyprotein - African clawed frog
C; Species: Xenopus laevis (African clawed frog)
C; Species: Xenopus laevis (African clawed frog)
C; Date: 22-Oct-1999 #sequence_revision 22-Oct-1999 #text_change
C; Accession: T30337
R; Yang, J.C.; Lindsay, L.L.; Hedrick, J.L.
submitted to the EMBL Data Library, March 1998
A; Description: cDNA cloning of ovochymase, a chymotrypsin-like p
A; Reference number: Z20829
A; Reference number: Z20829
A; Accession: T30337
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Residues: 1-1524 < YAN>
A; Cross-references: EMBL: U81290; NID: g2981640; PIC

(KLK-L) proteins for diagnosing orders, especially cancer. New kallikrein-like (KLK-L) protein mediated disorders, N-PSDB; AAA95944

and treating KLK-L

The present sequence is one of four alternatively spliced kallikrein-like proteins encoded by the human KLK-L4 gene. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used Claim 12; Page 172; 184pp; English

The present invention describes nucleic acids encoding PRO polypeptides

useful for preventing, diagnosing and treating diagnosing a

cardiovascular, endothelial or angiogenic disorder in mammals by

modulating cell proliferation, angiogenesis and cardiovascularisation,

and for identifying agonists and antagonists of these processes. The

nucleic acids and the proteins they encode may be used in the prevention,

treatment and diagnosis of diseases associated with inappropriate PRO

expression such as cardiovascular, endothelial or angiogenic disorders in

mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For

example, the nucleic acids (NCs) and vectors containing them and the PRO

polypeptide may be used to treat disorders associated with decreased PRO

expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent

nucleotide and protein sequences used in the exemplification of the
                                                                                                                                                                                Nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorders in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                PRO
                                                Human;
The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1303; PRO1755; PRO1780; PRO4334; PRO4927; PRO1557; PRO1295; PRO1203; PRO4304; PRO4354; PRO4397; PRO1927; PRO1555; PRO1096; PRO2038; and PRO2662. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polymucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

                                     AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention

                            raising
                                                proteins from a variety of organisms, including human, dog, cat, ho cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present server

                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nuclacids may also be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MGLSIFLLLCVLGLSQAATPKIFNGTECGRNSQPWQVGLFEGTSLRCGGVLIDHRWVLTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  . PRO1491 and PRO1571, useful in the ating a condition responsive to PRO nts e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AHCSGSRYWVRLGEHSLSQLDWTEQIRHSGFSVTHPGYLGASTSHEHDLRLLRLRLPVRV
